What is Coverseal?

Coverseal is a premium automatic pool cover engineered in Belgium and designed for year-round protection.

Unlike conventional pool covers that simply rest on the water, Coverseal uses a fully tensioned, pre-stressed membrane that travels along discreet aluminium tracks and seals the entire pool when closed.

The result is a unique combination of safety, convenience, energy efficiency and contemporary design.

Each Coverseal is custom designed and manufactured specifically for your pool. Its low-profile casing, slimline tracks and extensive range of colour and finish options allow the system to integrate seamlessly into both new and existing pool environments.

Engineered for daily use and all-season protection, Coverseal changes the way you live with your pool.

Form & function

SAFETY

Coverseal creates a strong, fully tensioned barrier across the entire pool, providing an additional layer of protection for children, pets and others around your pool. The heavy-duty membrane and unique locking system are engineered to remain securely tensioned whenever the cover is closed.

ENGINEERED FOR SERIOUS PROTECTION

Tested in accordance with the European NF P90-308 pool safety standard, the complete Coverseal system supports a 100 kg adult traversing the correctly installed and closed cover.

Coverseal is not intended for routine walking, standing, sitting or play and does not replace compliant pool fencing or active adult supervision.

EASE OF USE

A pool cover only delivers its full benefit when it is easy to use.

Coverseal has been designed to make opening and closing your pool quick, simple and virtually effortless. At the touch of a button, the automatic system travels along its low-profile tracks, sealing or uncovering your pool in minutes.

Bluetooth connectivity also allows the system to be operated through the Coverseal mobile app, putting simple control in the palm of your hand.

With minimal space required around the pool, Coverseal preserves access, movement and the clean architectural lines of your outdoor area.

ENERGY SAVINGS

An uncovered pool can lose significant amounts of water and heat through evaporation.

By creating a highly effective barrier across the pool surface, Coverseal dramatically reduces evaporation and helps retain heat within the pool water. This can reduce water consumption and lessen the energy required to maintain your preferred swimming temperature.

During the day, solar energy warms the cover and contributes to heat retention within the pool. Overnight, the sealed membrane helps prevent evaporation and the associated heat loss.

The result is a pool that is easier and more efficient to maintain throughout the year.

Coverseal adapts to your needs

No two pools or outdoor spaces are exactly the same.

Every Coverseal is custom made to suit the dimensions and configuration of your pool.

Choose from nine membrane colours, premium aluminium casing finishes and an extensive range of powder-coated colour options to create a Coverseal that complements your pool, landscaping and architectural style.

Whether subtle and understated or designed to make a statement, your Coverseal can be tailored to suit your space.
